#### **Focal Anterior Lesions**

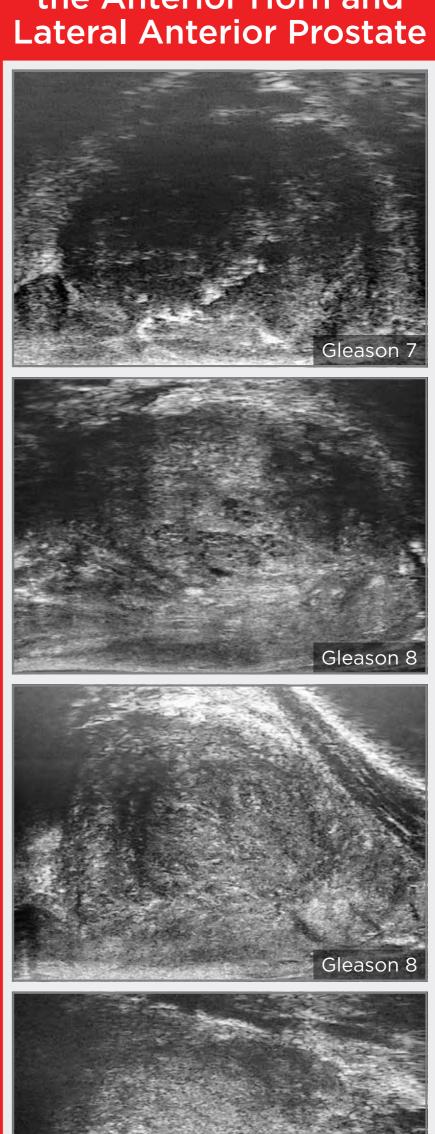

## Hypoechoic Finger-like Projections

#### Storm-cloud

Lesions Occupying the Anterior Horn and Lateral Anterior Prostate

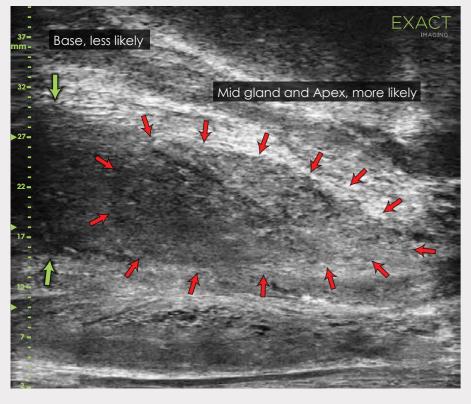

## Key Points for Anterior Prostate Imaging

Gleason 7

### PRI-MUS Anterior - Pitfalls

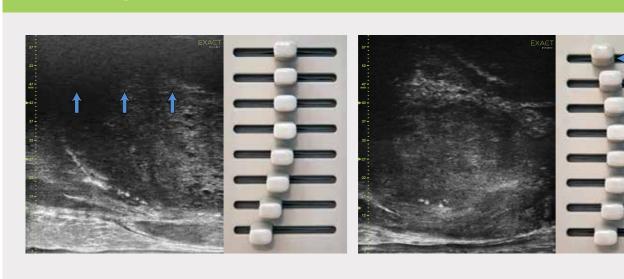

#### **Anterior Apex**

Most common locations for AP cancer.

- → Use the existing PRI-MUS chart to evaluate the anterior apical horn and lateral anterior PZ for suspicious features.
- → Use the correct apical horn sampling technique to ensure good coverage of the anterior apex.
- → Pay close attention to the capsular anterior mid gland and anterior apex during assessment. This is where most AP cancer occurs.

#### TGC Optimization

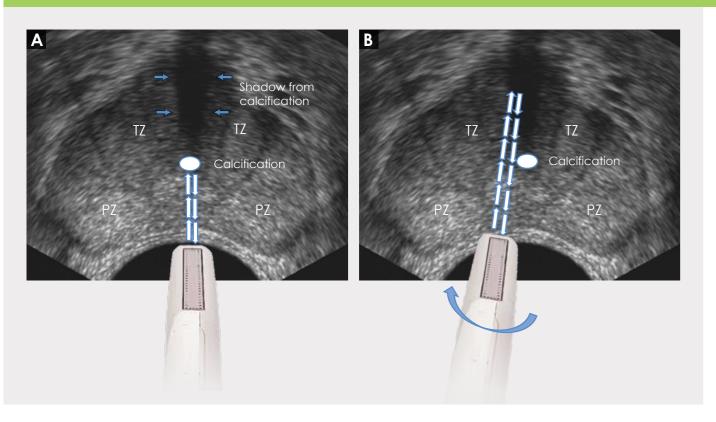

Adjustment of the top TGC sliders to minimize 'noise' in the far field.

A hazy, noisy far field can be rectified by 'bending' the top TGC sliders to the left.

- Use an appropriate depth setting for interrogating the AP and AP capsule. AP Cancer is just as likely a finding in a small gland as in a very large gland.
- Linear zone boundaries can be balanced with use of appropriate gain and TGC settings.
- Try 'bending' the top three TGC sliders to the left to reduce any far field noise in the image.

#### **Handling Calcifications**

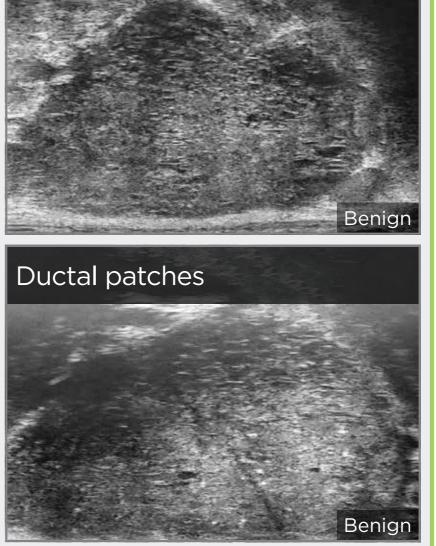

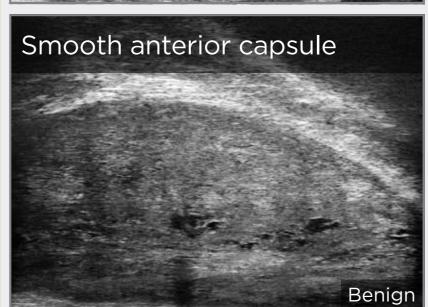

- → Apply gentle probe pressure to dissipate subtle shadowing artifacts.
- → Manipulate and angle the probe to overcome dense calcifications along the line of the urethra.
